ORBIT OF THE SPECTROSCOPIC BINARY 23 CASSIOPEÆ.

BY REYNOLD K. YOUNG, Ph.D.

The binary character of 23 Cassiopeæ ($\alpha=0^h 41^m 1$, $\delta=+74^\circ 18'$, 1900, mag. 5.39, type B8) was announced by Adams in 1912.* Sixty-one spectrograms, taken with a one-prism spectrograph at this observatory during 1914 and 1915, have been used in determining an orbit.

The principal lines showing in the spectrum are given in Table I which gives in order:—The wave-lengths used, the elements to which the wave-lengths are assigned, the residuals, and the number of times each line was measured. The residual for any line is the mean (algebraic or arithmetic) of all the residuals for that line. The separate residuals are found by subtracting the velocity as given by the plate from the velocity as given by the line.

TABLE I.

Wave- Length.	Element	Algebraic Residual	Arithmetic Residual.	Number of times measur'd	Wave- Length.	Element	Algebraic Residual.	Arithmetic Residual.	Number of times measur'd
3933.825	Calcium	0.0	3.6	50	4340.634	Hydrogen	- 0.8	5.1	59
4101.890	Hydrogen	- 1.2	4.4	44	4481.400	Magnesium	+ 1.2	6.6	44
4128.211	Silicon	0.0	7.1	39	4549.766	Iron	+ 5.9	8.7	7
4131.047	Silicon	+ 0.5	5.9	39

A period was determined from the Ottawa series of spectrograms and then adjusted from five plates taken from the Mt. Wilson observatory (Table II). The time covered by the observations is about forty periods. The final period adopted was 33.75 days. With this element fixed, the sixty-one velocities were grouped into thirteen normal places and approximate elements derived.

$$T = \text{Julian Day } 2,420,577.34$$

$$K = 17.0 \text{ km.}$$

$$\omega = 270^\circ$$

$$e = 0.40$$

$$\gamma = -4.08$$

$$P = 33.75 \text{ days.}$$

NORMAL PLACES.

where

$$x = d\gamma$$

$$y = dK$$

$$z = Kde$$

$$p = Kd\omega$$

$$q = \frac{K\mu}{(1-e^2)^{\frac{3}{2}}} dT$$

NORMAL EQUATIONS.

$$\begin{aligned}
 13.900x - 0.981y + 1.828z + 0.604p - 1.197q - 0.720 &= 0 \\
 + 7.442y + 0.454z - 2.501p + 0.951q + 4.569 &= 0 \\
 + 9.278z + 2.373p - 0.760q - 0.113 &= 0 \\
 + 5.890p - 4.861q - 0.047 &= 0 \\
 + 5.668q - 1.276 &= 0
 \end{aligned}$$

$$\begin{aligned}
 \text{whence, } d\gamma &= +0.02 \text{ km.} \\
 dK &= -0.68 \text{ km.} \\
 de &= +0.005 \\
 d\omega &= -0^\circ.29 \\
 dT &= +0.07 \text{ day.}
 \end{aligned}$$

The above corrections lowered Σp^2 from 24.7 to 22.7. While this is not a very great reduction, the fact that about two-fifths of this quantity arises from the residual 3.5 km. and also considering the fact that residuals computed from the observation equation and ephemeris agree to within 0.2 km., a second least-squares solution would not improve the orbit to a very great extent, if at all.

The final elements are:—

$$\begin{aligned}
 T &= \text{Julian Day } 2,420,577.41 \pm 0.27 \\
 K &= 16.32 \text{ km.} \pm 0.50 \\
 \omega &= 269^\circ.71 \pm 4^\circ.10 \\
 e &= 0.405 \pm 0.026 \\
 \gamma &= -4.06 \pm 0.34 \\
 P &= 33.75 \text{ days} \\
 a \sin i &= 7,020,000 \text{ km.} \\
 \frac{m_1^3 \sin^3 i}{(m+m_1)^2} &= 0.0121 \odot
 \end{aligned}$$

The individual observations were represented graphically, and the residuals are shown in Tables II and III. The probable error of a single plate as computed from the formula $r = 0.6745 \sqrt{\frac{\Sigma p^2}{n-1} \cdot \frac{n}{\Sigma p}}$ is 3.4 kilometres.

Dominion Observatory,
Ottawa,
April, 1915.
